LANGUAGE IN URL's

Extension For Magento 2

Testing on Magento 2.1 with Sample Data.
Version 1.0 (23.04.17)

Language In Url

One of the features of Magento 2 is support for multiple websites, multiple stores and multiple languages. This means that you can have one installation of Magento, and use it for multiple websites. From there, each site can have different stores, and each store can be in different languages.

When deploying a multi-language stores is important to consider that each translated version of the page has a unique URL-address of the page. Thus, search engines and the users of the site can determine that this translated version of the page. With Magento 2 we can easily change the base URL-address of each store to achieve this.

There are different domain structures that are used for multilingual shops. This extension enables the use of sub-directories for different language versions of the store (e.g. <http://store.com/en/>, <http://store.com/fr/>, <http://store.com/pl/>).

The main module functions include:

- adding a subdirectory to store the language;
- full integration with all standard modules Magento 2;
- It works perfectly with the cache;
- It makes the site more friendly for SEO.

Installation:

- Copy the folder with the module at the root of your site;
- run the following command:
 php bin/magento setup:upgrade
 php bin/magento setup:di:compile
 php bin/magento setup:static-content:deploy
 php bin/magento cache:clean
- after they are completed, you should see in the app/etc/config.php this module.

Setting:

Go to admin -> stores -> configuration -> general -> web.

- select store view;
- set language code for current store view in section Language code in url;
- repeat this actions for all languages current web

Configuration

Q ? admin

Store View: Default Store View ?

Language in Url

Enable [website] Yes
Enable this option only after making sure that all other settings are correct. Otherwise, errors may occur and the module will not work correctly.

Always use code [website] Yes

Store switch type [website] change url for store

Exclude Request Uri [website] /rest /soap

Enable this option only if you make sure that everything is configured correctly. Otherwise, there may be errors on the site. For example, a site can constantly redirect.

Do not forget to include a module for the web site is possible only when all the settings for languages filled. There should be no empty language code for the store view.

Field Exclude Request Uri default must have an address /rest and /soap. This adjustment is needed in order to work correctly REST and SOAP API.

It is also important to know that **if you use https in the website, you should use https in the admin panel.**

Next you need to clean the cache and go to the store. Try changing the language using the form language of choice. If you have everything configured correctly, it will redirect to the address, which is the language code. If you see an error on the site, or the site began to constantly make redirect, then perhaps you have done something wrong.

Do not forget about the module configuration when adding a new language to the website.

Note: The extension can override the files that you already use. Make sure that there are no conflicts with your modules before using this module. The module has been tested on Magento 2.1 with Sample Data.
